

GAS BARN (LPG/BIOGAS)

The Gas Cure Barn is an advanced, fully automated tobacco curing system designed for precision, efficiency, and sustainability. Powered primarily by LPG, it provides clean, high-calorific combustion with minimal emissions, reducing deforestation and ensuring stable thermal output. The system operates through programmable controls where users input curing parameters, enabling autonomous regulation of temperature, humidity, and airflow without continuous supervision. Its fully insulated structure ensures uniform heat distribution, producing consistent leaf quality throughout the barn. A complete curing cycle is achieved in 5.5-6 days with reduced stress on leaf physiology. The system is also biogas-ready, supporting future renewable energy integration and sustainable production.

KUSAGA
For Productivity. For Sustainability
